

## Python Basics for Data Science

### Module 1 Glossary: Python Basics

Term	Definition
<b>Boolean</b>	A data type that can take on two values: 0 or 1, where 0 represents false and 1 represents true.
<b>Concatenate</b>	Combining two or more strings into a single string.
<b>Expression</b>	An operation that Python executes such as add or subtract.
<b>Float</b>	A number with a decimal point.
<b>Integer</b>	A positive or negative whole number.
<b>Operand</b>	A numeric value in an expression.
<b>Operator</b>	A math symbol used to combine operands in an expression.
<b>String</b>	A string is a data type containing alphanumeric characters or symbols. When defining a string the string should be enclosed in single or double quotes.
